Creating and Modifying Your Own Nameservers

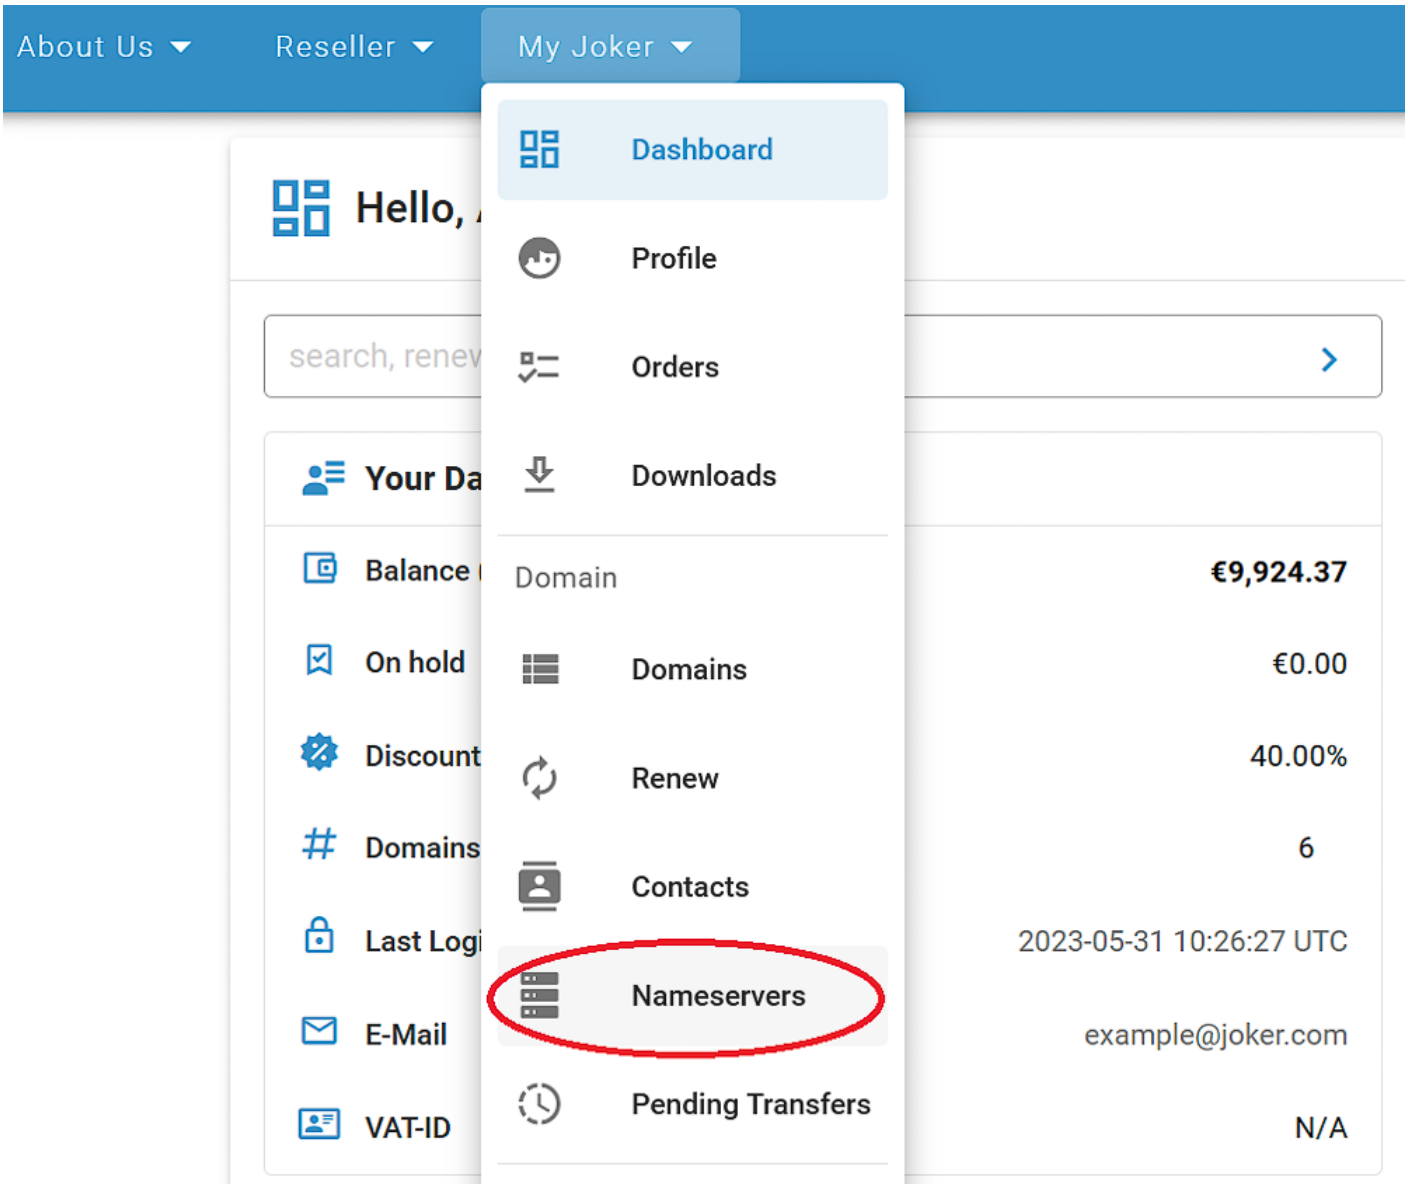

If you prefer not to use the free Joker.com name service and instead want to use your own nameservers, you need to "register" it.

> **Please note:** Creating nameservers (e.g., registering a hostname with an IP address to define a nameserver) **only works** with Joker.com if the domain used for these nameservers is **also a Joker.com domain**. This limitation is based on technical/registry constraints.

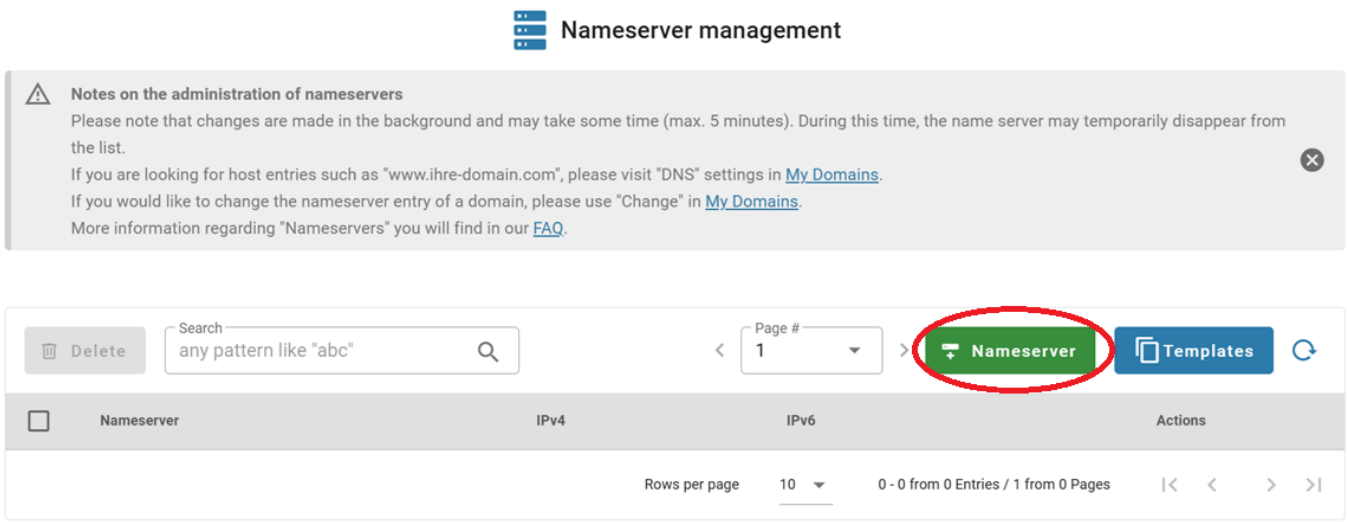

If you intend to use a domain from another registrar, only that registrar will be able to register the nameservers with the registry.

To register your own nameservers, please follow these steps:

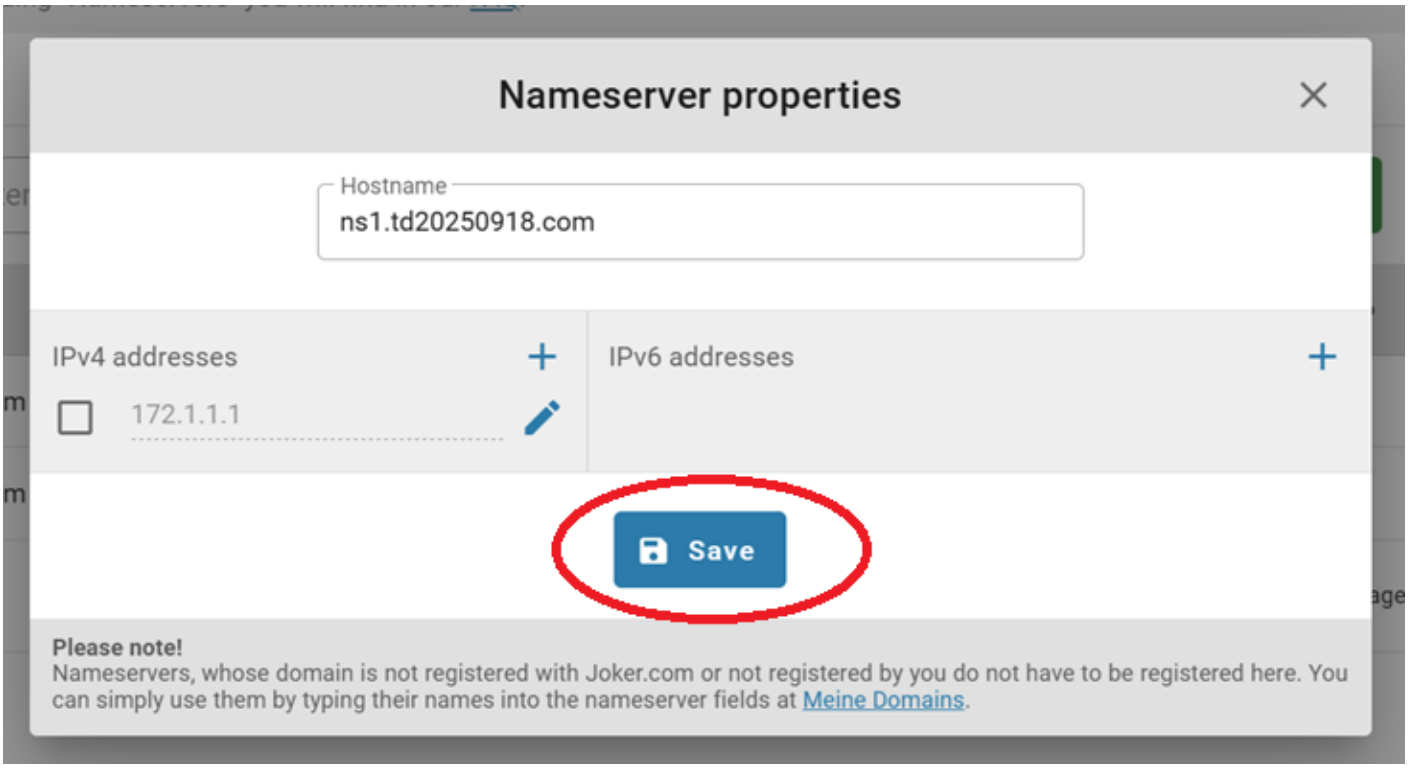

1. Choose "Nameservers" from the "My Joker" menu:

2. Click on the "Nameserver" button:

2. Add the host name and IP addresses, save them, and click on the "Save" button when it becomes active:

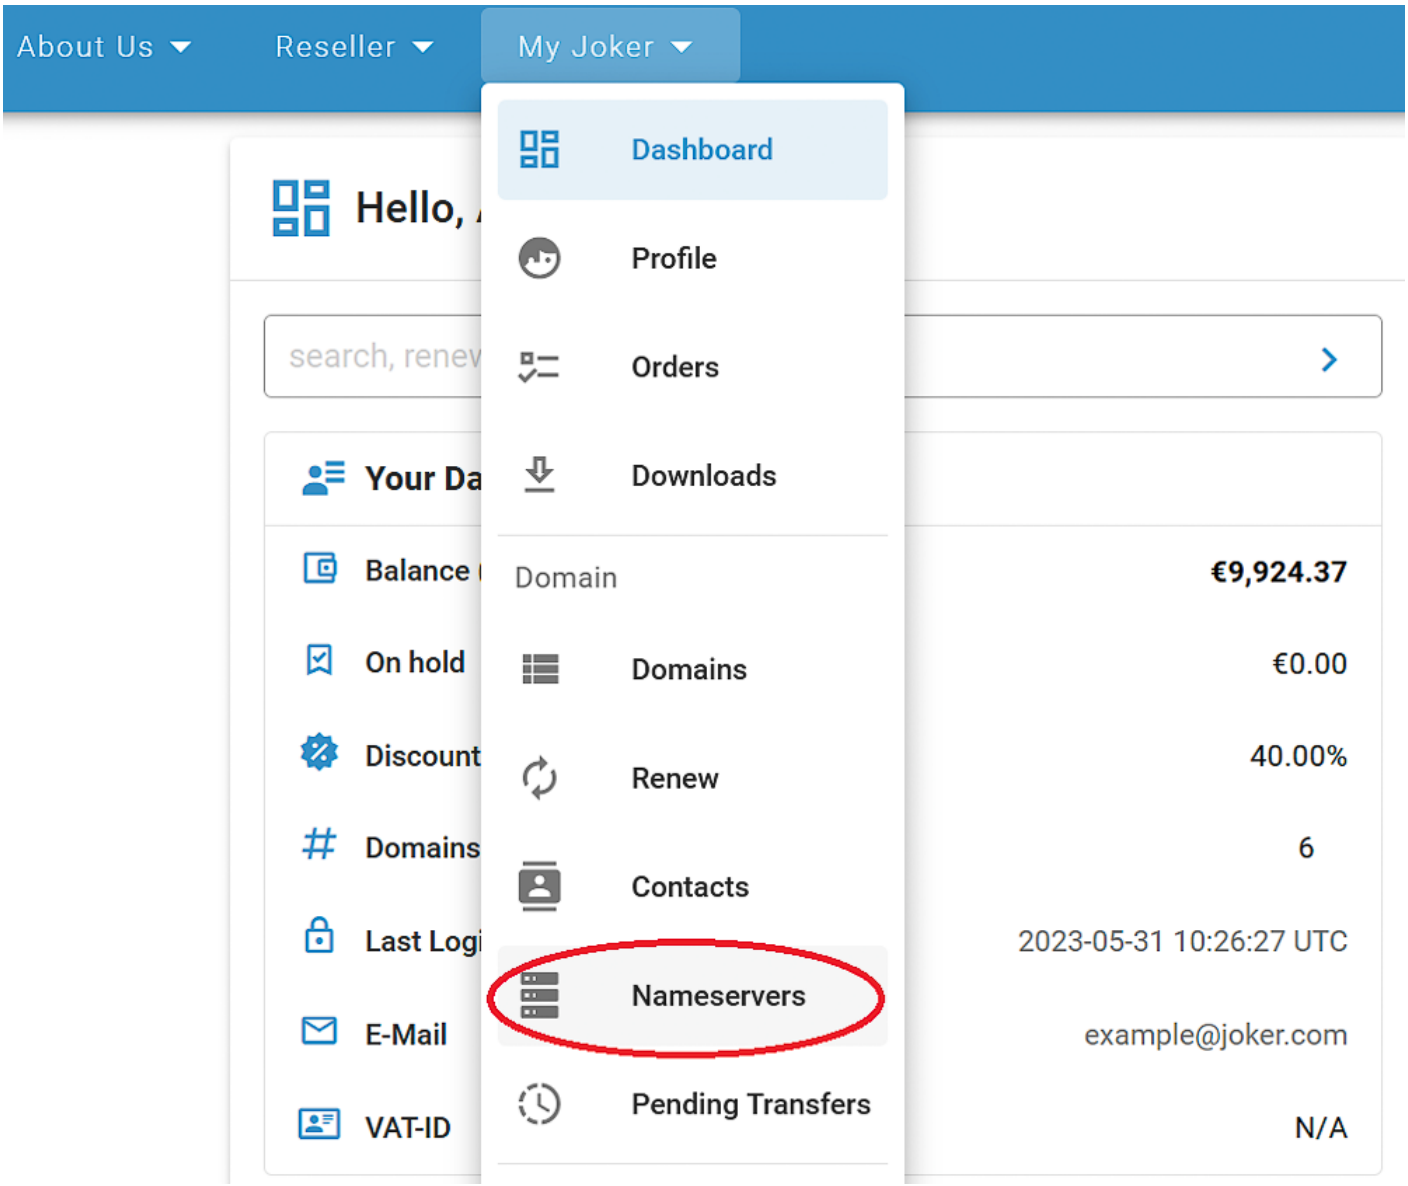

You're done!

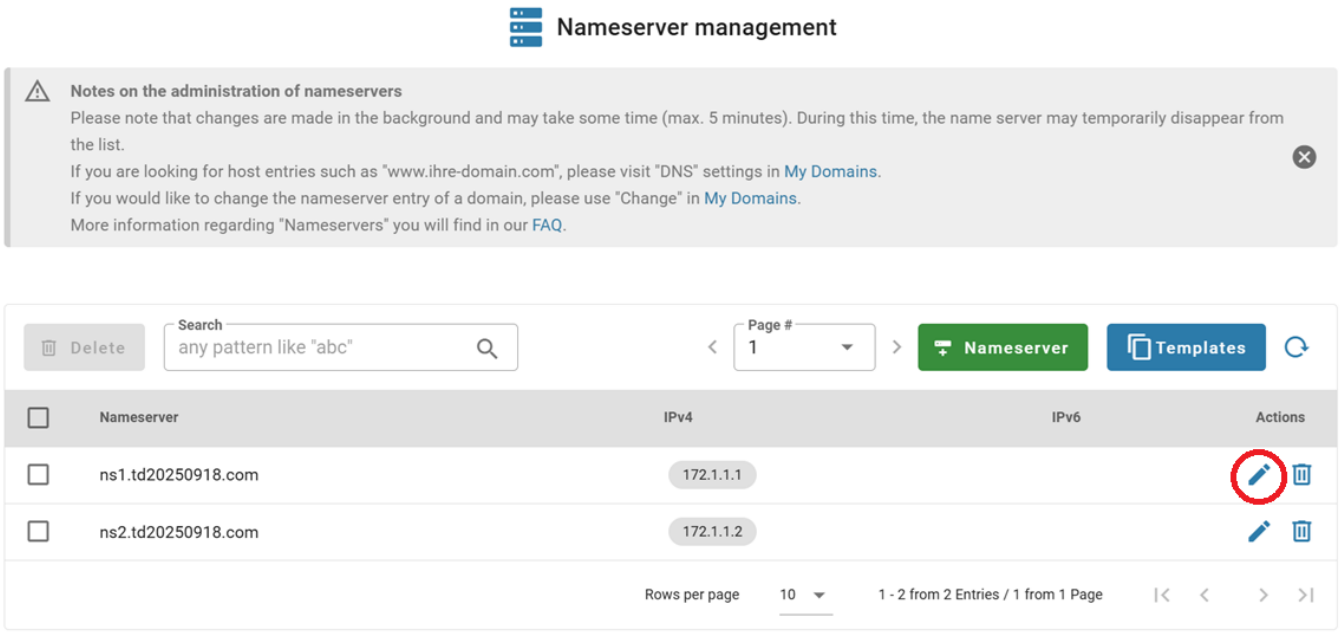

Modifying Your Own Nameservers

If you want to modify the Nameserver you have previously created, you need to follow these steps:

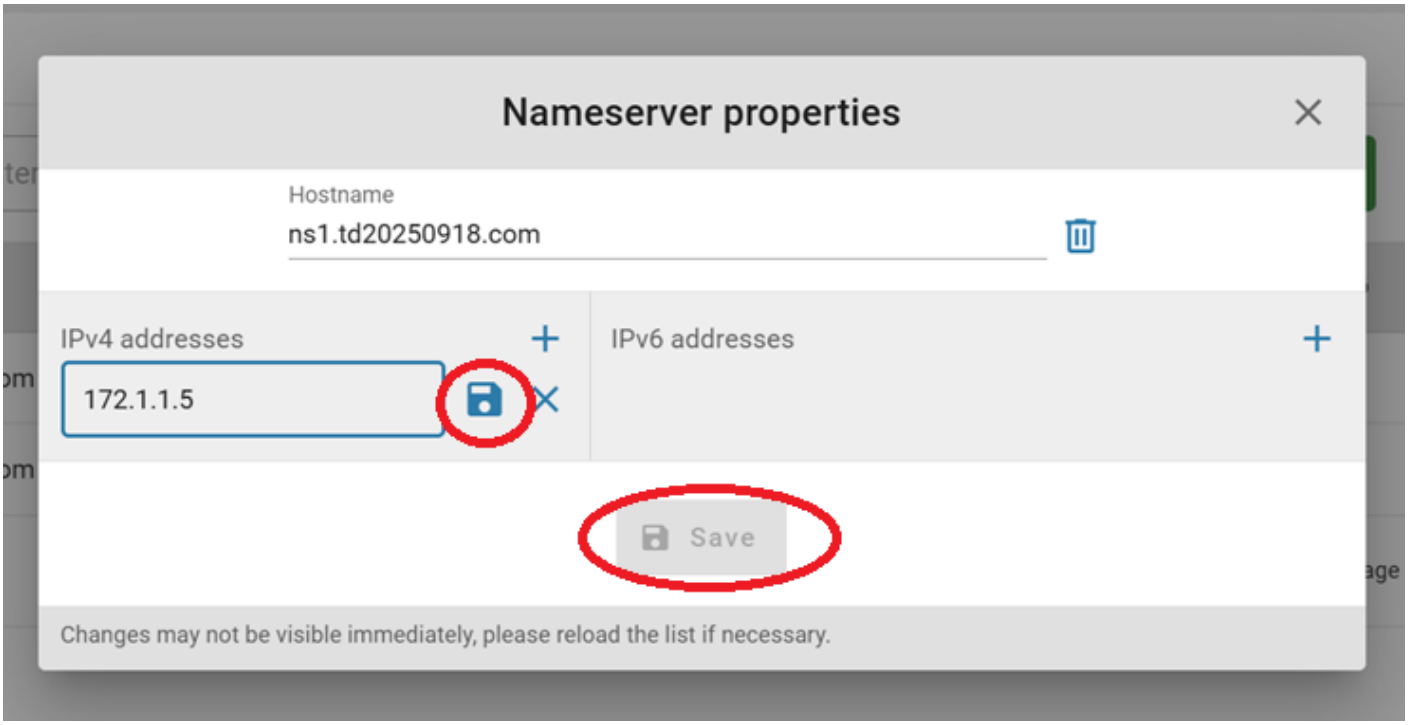

1. Choose "Nameservers" from the "My Joker" menu:

2. Search for the Nameserver you would like to modify, and click the "Edit" icon:

3. Make necessary changes, save them, then click "Save" after it activates:

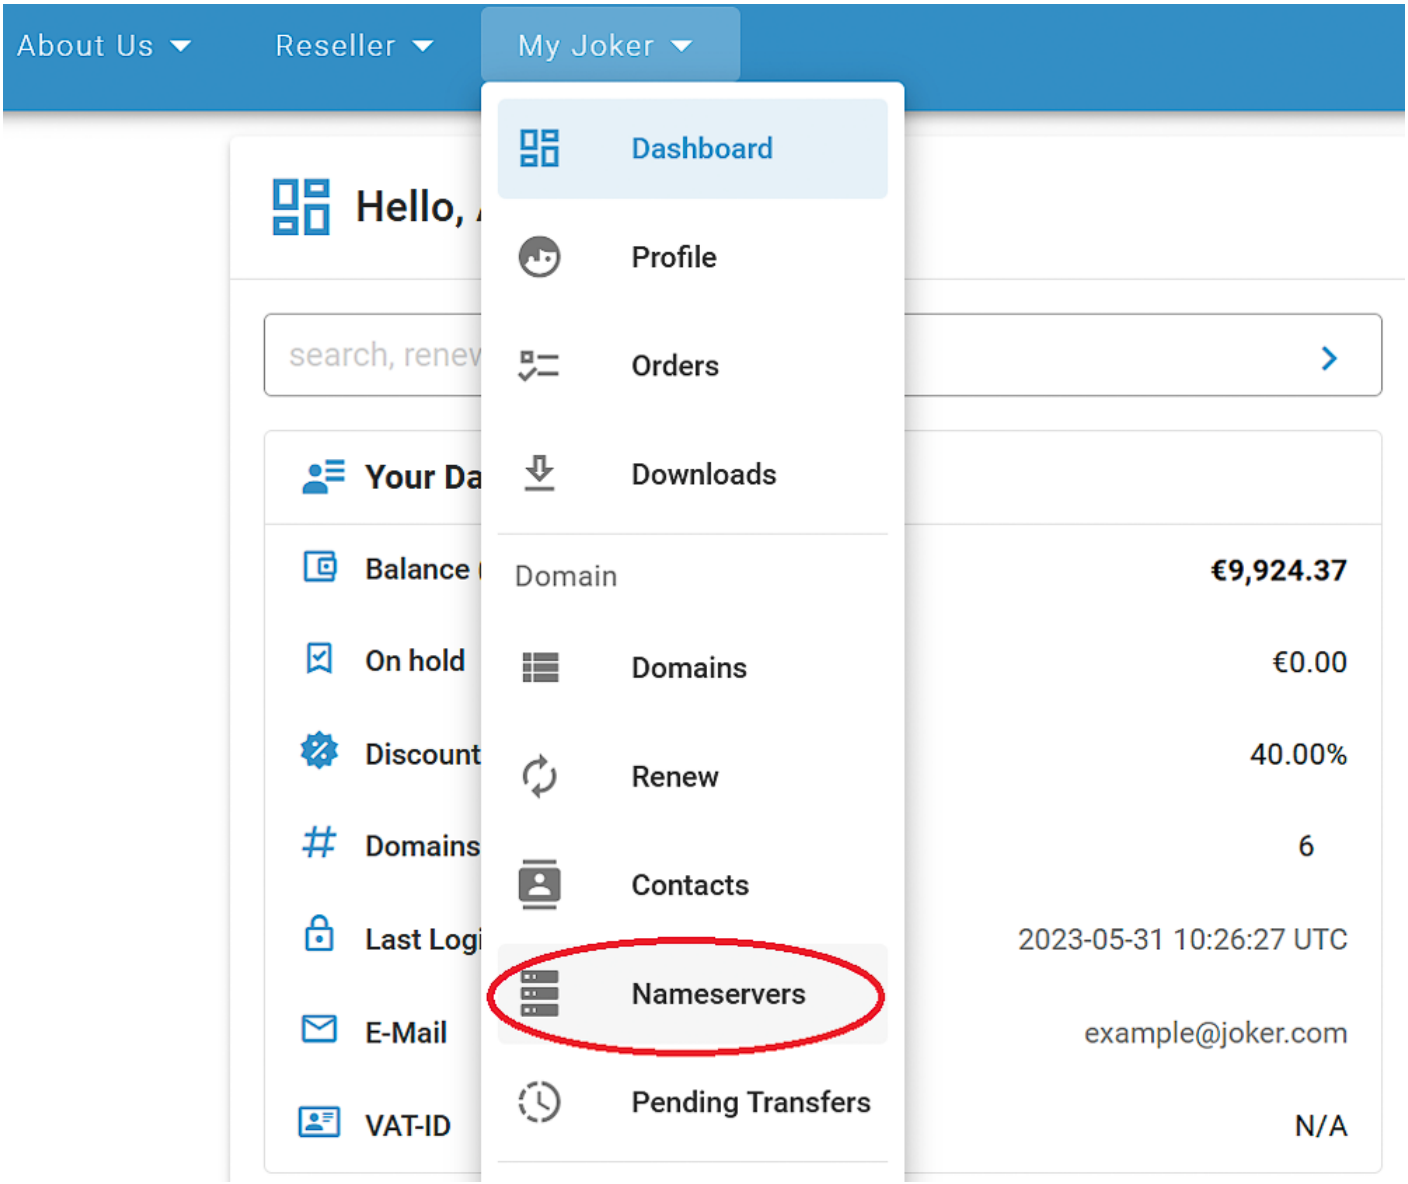

After a successful change, you will receive a confirmation email.

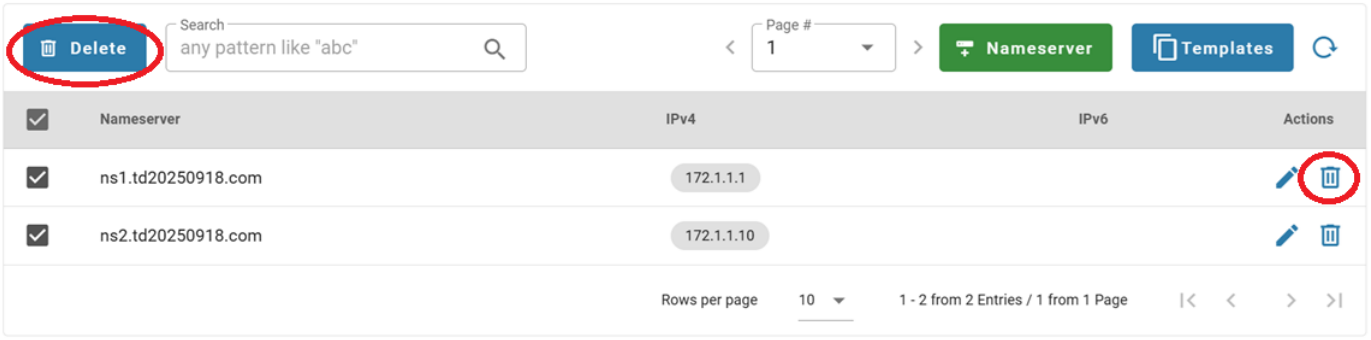

Deleting Your Nameservers

If you want to delete one of your previously registered Nameservers, you can do this easily by following the steps below:

1. Choose "Nameservers" from the "My Joker" menu:

2. Either click on the "Delete" icon next to the nameserver you want to delete, or select multiple and click the "Delete" button:

Please note: Only Nameservers that are **not linked** to any domain (even if they are in the RGP) can be deleted. If the selected name server is still in use, it cannot be deleted.
